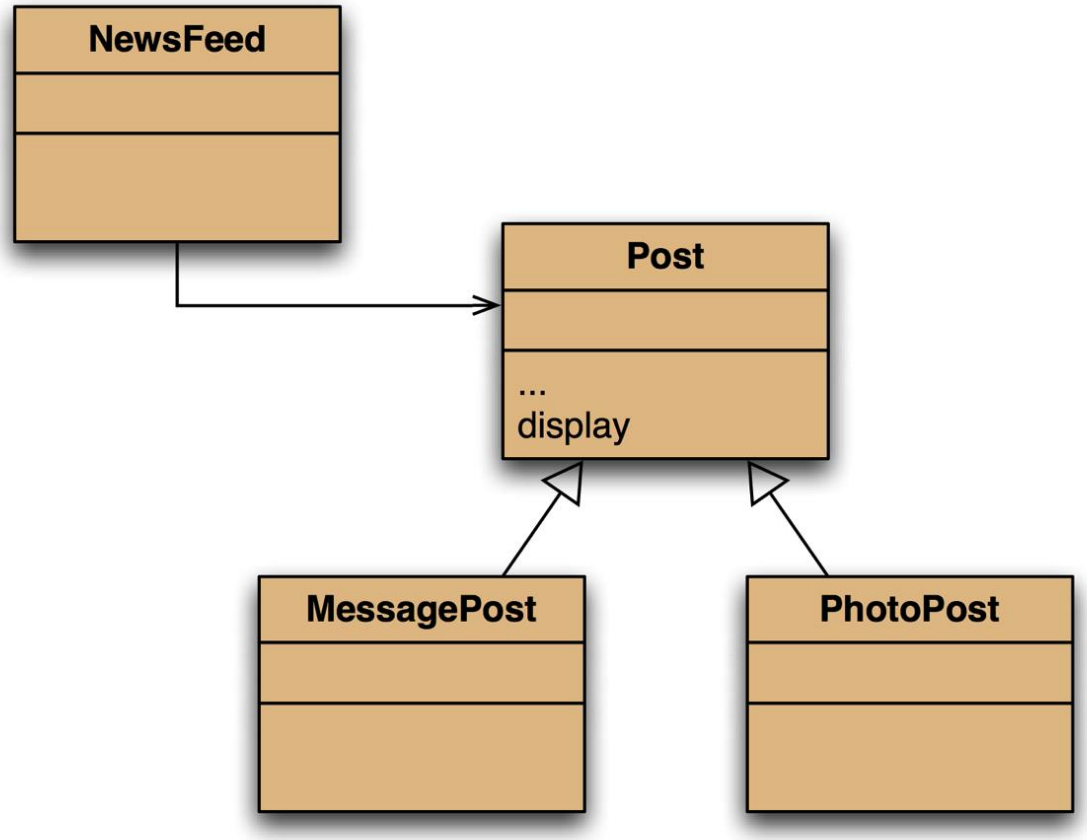
# Lectures and Labs

- This weeks lectures and labs are based on examples in:
  - Objects First with Java - A Practical Introduction using BlueJ, © David J. Barnes, Michael Kölling (https://www.bluej.org/objects-first/)

# Topic List

- Method polymorphism
- Static and dynamic type
- Overriding
- Dynamic method lookup
- Protected access

# NetworkV2 – Inheritance Hierarchy



# Testing the display method…

**Create this MessagePost**

```
Leonardo da Vinci
Had a great idea this morning.
But now I forgot what it was. Something to do
with flying ...

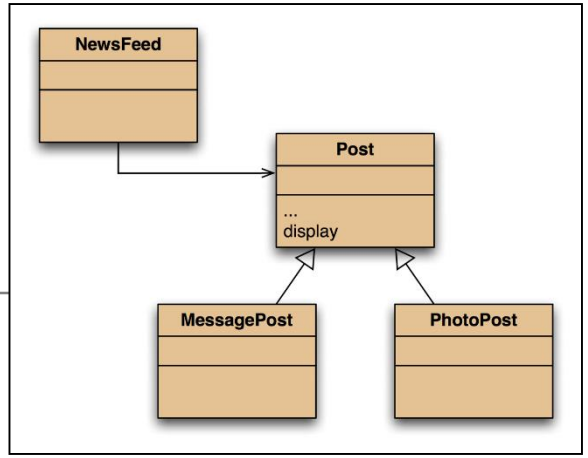
What we have

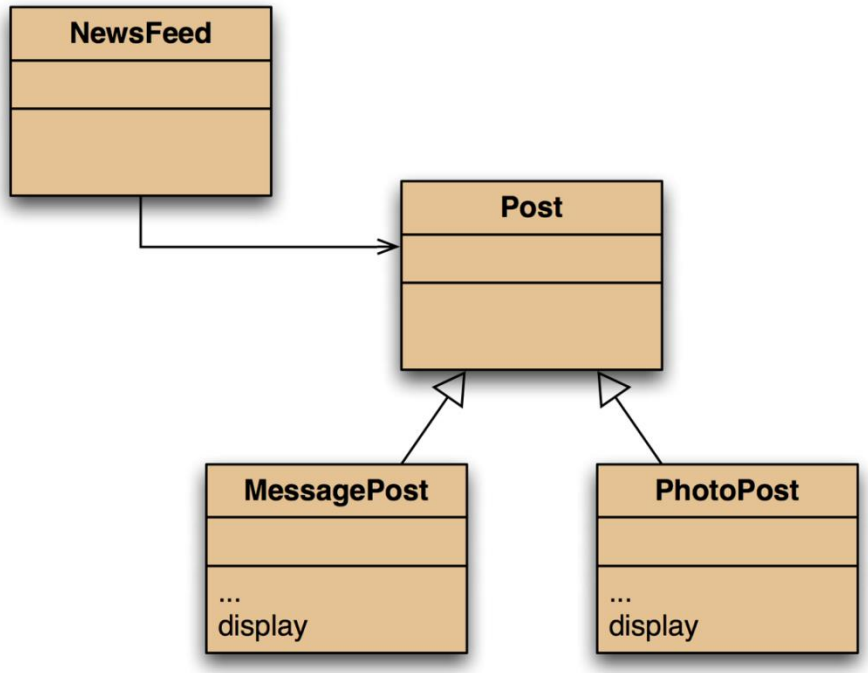
# The problem



- The **`display`** method in **`Post`** only prints the common fields.

- Inheritance is a one-way street:
  - A subclass inherits the superclass fields.
  - The superclass knows nothing about its subclass's fields.

# Attempting to solve the problem?



- Place **`display`** where it has access to the information it needs.
- Each subclass has its own version.

**But**:

- **`Post`**'s fields are private.
- **`NewsFeed`** cannot find a **`display`** method in **`Post`**.

# Topic List

- Method polymorphism
- Static and dynamic type
- Overriding
- Dynamic method lookup
- Protected access

# Static type and dynamic type

- A more complex type hierarchy requires further concepts to describe it.

- Some new terminology:
  - static type
  - dynamic type
  - method dispatch/lookup

# Static and dynamic type

What is the type of c1?

```
Car c1 = new Car();
```

What is the type of v1?

```
Vehicle v1 = new Car();
```

# Static and dynamic type

What is the type of c1?

```
Car c1 = new Car();
```

What is the type of v1?

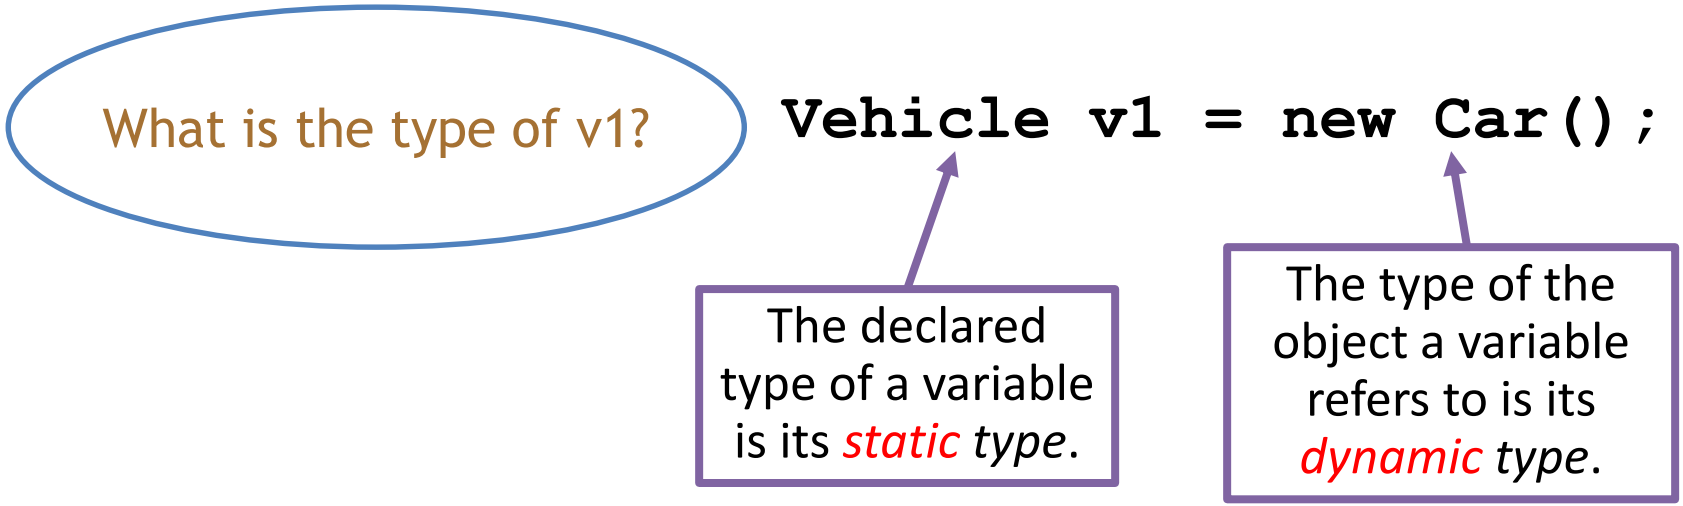
```
Vehicle v1 = new Car();
```

The declared type of a variable is its *static type*.

The type of the object a variable refers to is its *dynamic type*.

# Static and dynamic type

*The compiler's job is to check for static-type violations.*



# Recall our attempt to solve this problem…

```
Leonardo da Vinci
Had a great idea this morning.

```

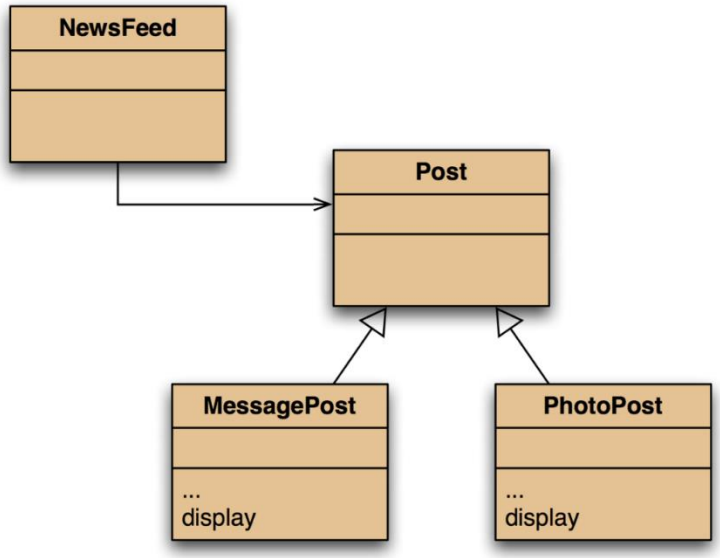
What we have

# Recall our attempt to solve this problem…



- We placed **`display`** in each subclass where it has access to the information it needs.

**But**:

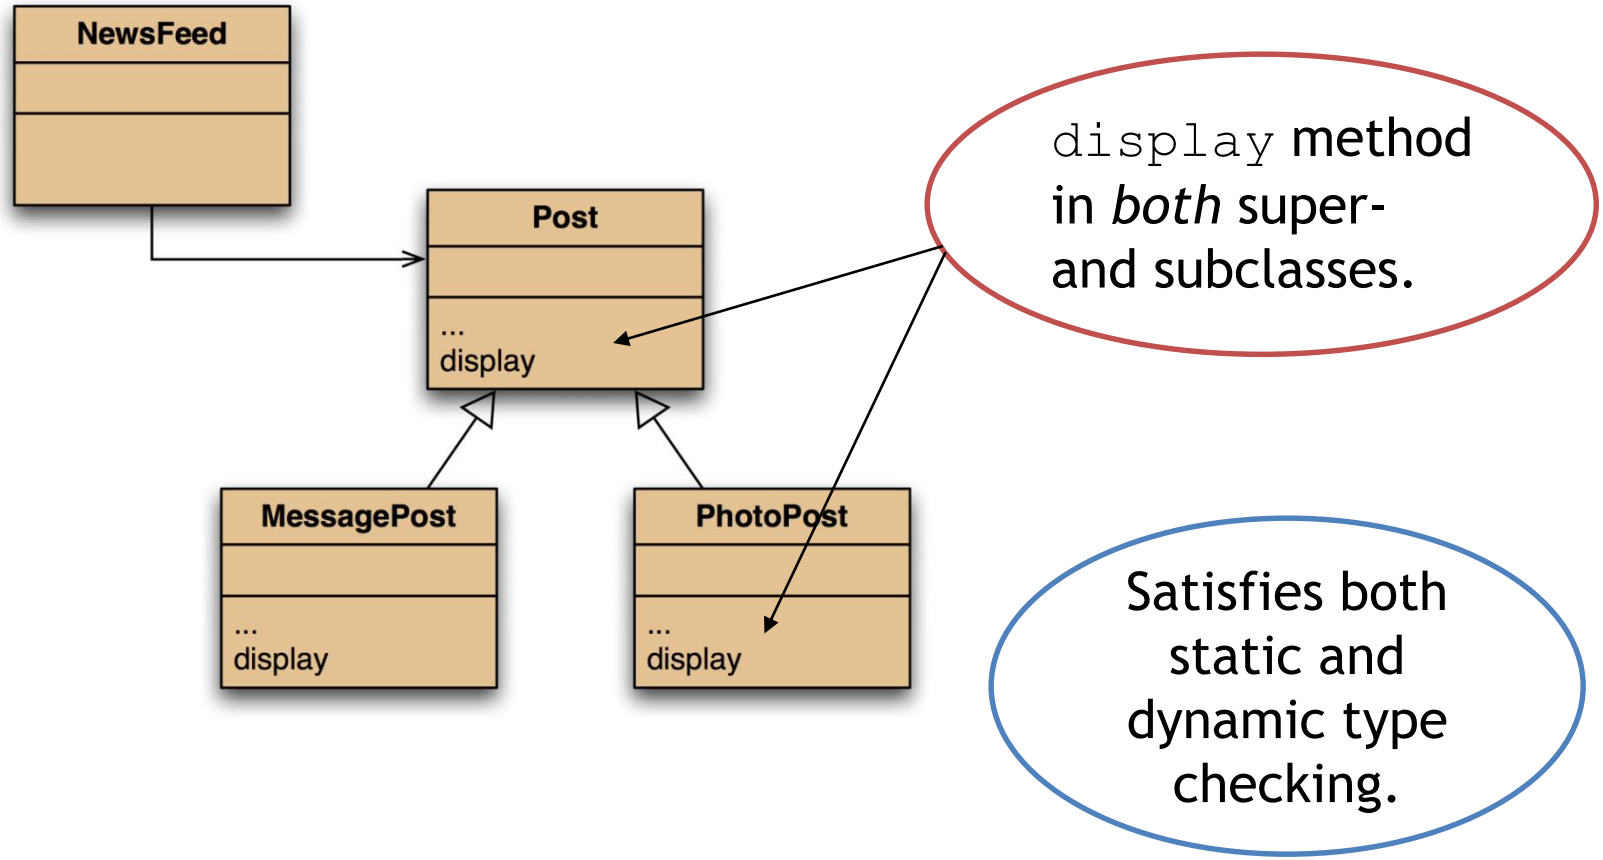
- **`Post`**'s fields are private and **`NewsFeed`** cannot find a **`display`** method in **`Post`**.

```
for(Post post : posts) {
  post.display(); // Compile-time error (static-type violation)
                  // method display() is not found in the
                  // Post class
  }
```

# Topic List

- Method polymorphism
- Static and dynamic type
- Overriding
- Dynamic method lookup
- Protected access

# Overriding - the solution to our problem



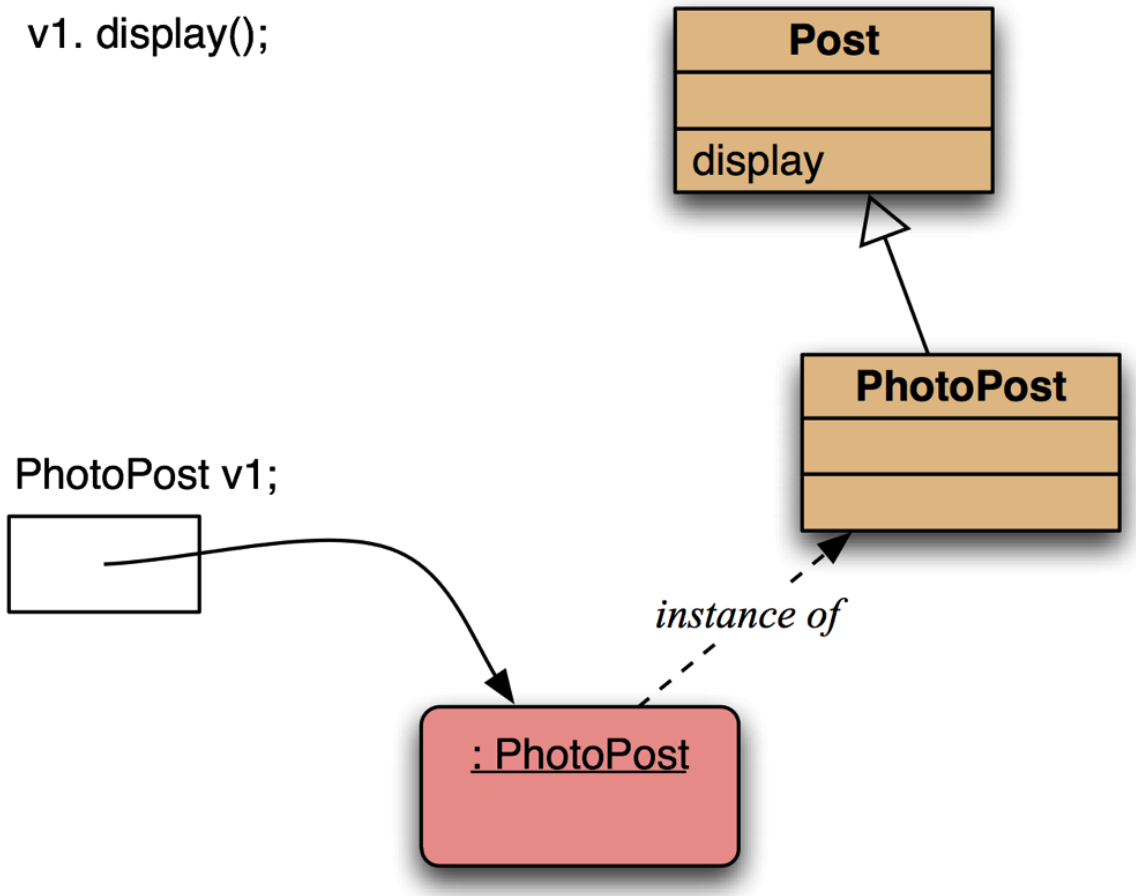
# Overriding

- Superclass and subclass define methods with the same signature.
- Each has access to the fields of its class.
- Superclass satisfies static type check.
- Subclass method is called at runtime – it *overrides* the superclass version.
- What becomes of the superclass version?

# Topic List

- Method polymorphism
- Static and dynamic type
- Overriding
- Dynamic method lookup
- Protected access

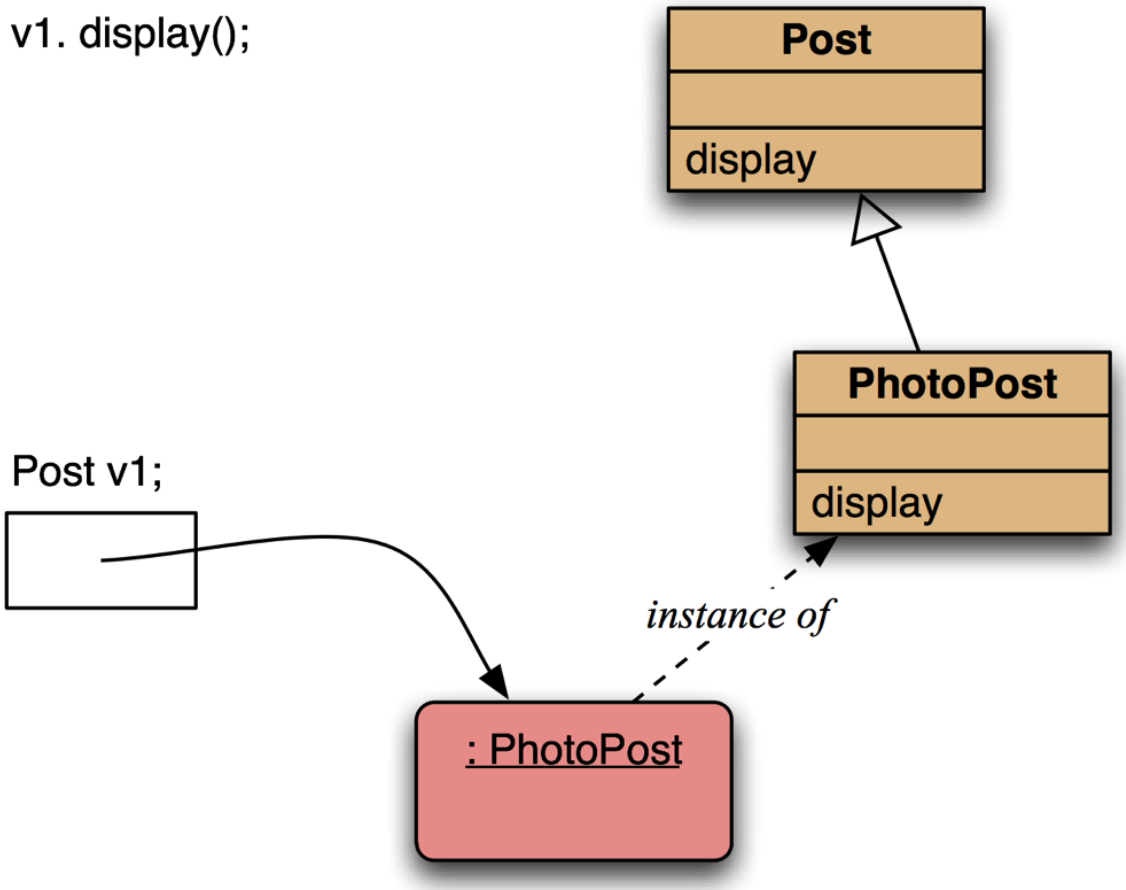
# Dynamic method lookup



Inheritance but no overriding.

The inheritance hierarchy is ascended, searching for a match.

# Dynamic method lookup



Polymorphism and overriding.

The ‘first’ version found is used.

# Dynamic method lookup summary

1. The variable is accessed.
2. The object stored in the variable is found.
3. The class of the object is found.
4. The class is searched for a method match.
5. If no match is found, the superclass is searched.
6. This is repeated until a match is found, or the class hierarchy is exhausted.
7. Overriding methods take precedence.

# Super call in methods

- Overridden methods are hidden ...
- ... but we often still want to be able to call them.
- An overridden method *can* be called from the method that overrides it.
  - **`super.method(...)`**
  - Recall we used **`super`** in our constructors.

# Calling an overridden method

```
public void display()
{
    super.display();
    System.out.println(" [" +
                       filename +
                       "]");
    System.out.println(" " + caption);
}
```

# Method polymorphism

- We have been discussing *polymorphic method dispatch*.
- A polymorphic variable can store objects of varying types.
- Method calls are polymorphic.
  - The actual method called depends on the dynamic object type.

# The `instanceof` operator

- Used to determine the dynamic type.
- Can recover 'lost' type information.
- Usually precedes assignment with a cast to the dynamic type:

- ```
  if(post instanceof MessagePost) {
      MessagePost msg =
          (MessagePost) post;
      ... e.g. then access MessagePost methods via msg ...
  }
  ```
  ```

# Recall the Object class…

java.lang

## Class Object

java.lang.Object

---

`public class` **`Object`**

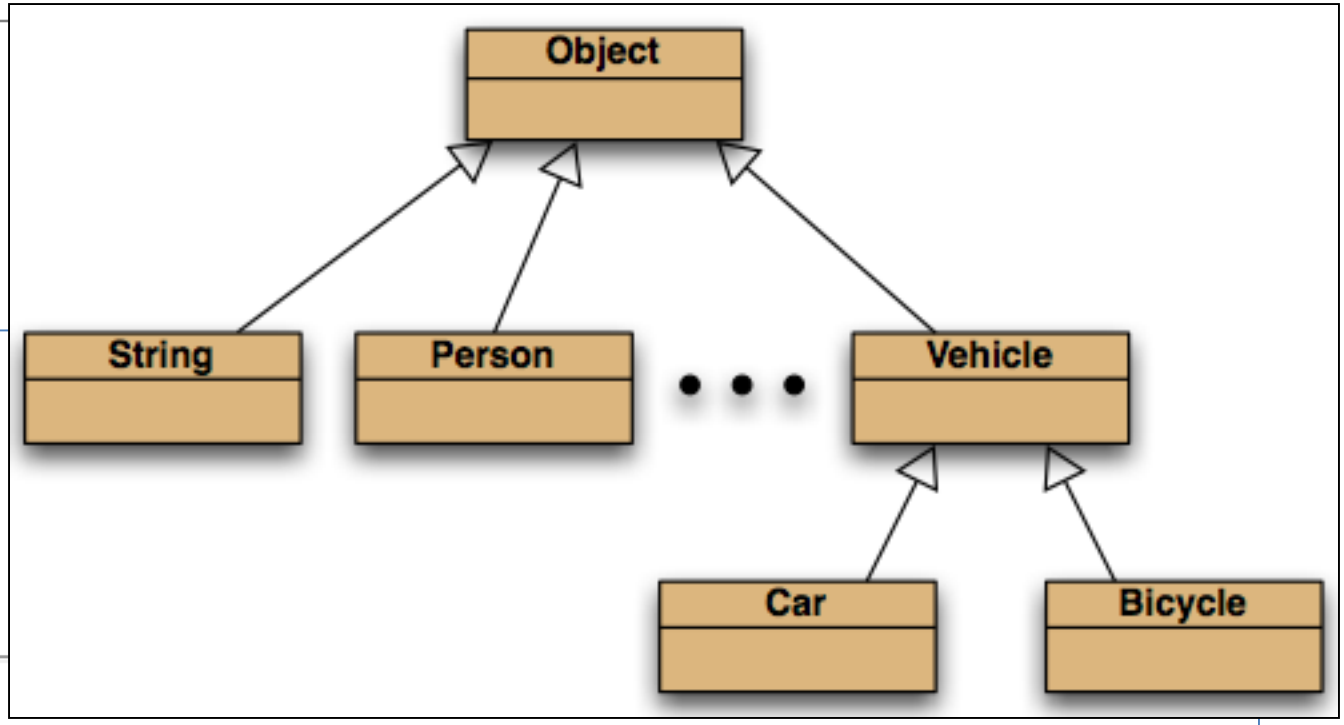
Class `Object` is the root of the class hierarchy. Every class has `Object` as a superclass. All objects, including arrays, implement the methods of this class.

**Since:**

JDK1.0

# Recall the Object class…

*All classes inherit from* **Object**.



java.lang

## Class Object

java.lang.Object

---

`public class Object`

Class `Object` is the root of the class hierarchy. Every class has `Object` as a superclass. All objects, including arrays, implement the methods of this class.

**Since:**

JDK1.0

Methods in **`Object`** are inherited by all classes.

Any of these may be overridden.

**Methods**

| Modifier and Type | Method and Description |
|---|---|
| `protected Object` | **`clone()`**<br>Creates and returns a copy of this object. |
| `boolean` | **`equals(Object obj)`**<br>Indicates whether some other object is "equal to" this one. |
| `protected void` | **`finalize()`**<br>Called by the garbage collector on an object when garbage collection determines that there are no more references to the object. |
| `Class<?>` | **`getClass()`**<br>Returns the runtime class of this `Object`. |
| `int` | **`hashCode()`**<br>Returns a hash code value for the object. |
| `void` | **`notify()`**<br>Wakes up a single thread that is waiting on this object's monitor. |
| `void` | **`notifyAll()`**<br>Wakes up all threads that are waiting on this object's monitor. |
| `String` | **`toString()`**<br>Returns a string representation of the object. |
| `void` | **`wait()`**<br>Causes the current thread to wait until another thread invokes the **`notify()`** method or the **`notifyAll()`** method for this object. |
| `void` | **`wait(long timeout)`**<br>Causes the current thread to wait until either another thread invokes the **`notify()`** method or the **`notifyAll()`** method for this object, or a specified amount of time has elapsed. |
| `void` | **`wait(long timeout, int nanos)`**<br>Causes the current thread to wait until another thread invokes the **`notify()`** method or the **`notifyAll()`** method for this object, or some other thread interrupts the current thread, or a certain amount of real time has elapsed. |

**Methods**

| Modifier and Type | Method and Description |
|---|---|
| protected Object | clone()<br>Creates and returns a copy of this object. |
| boolean | equals(Object obj)<br>Indicates whether some other object is "equal to" this one. |
| protected void | finalize()<br>Called by the garbage collector on an object when garbage collection determines that there are no more references to the object. |
| Class<?> | getClass()<br>Returns the runtime class of this Object. |
| int | hashCode()<br>Returns a hash code value for the object. |
| void | notify()<br>Wakes up a single thread that is waiting on this object's monitor. |
| void | notifyAll()<br>Wakes up all threads that are waiting on this object's monitor. |
| String | toString()<br>Returns a string representation of the object. |
| void | wait()<br>Causes the current thread to wait until another thread invokes the this object. |

The **`toString`** method is commonly overridden:

```
public String toString()
```

Returns a string representation of the object.

# Overriding `toString` in `Post`

```
public String toString()
{
    String text = username + "\n" + timeString(timestamp);

    if(likes > 0) {
        text += " - " + likes + " people like this.\n";
    }
    else {
        text += "\n";
    }

    if(comments.isEmpty()) {
        return text + " No comments.\n";
    }
    else {
        return text + " " + comments.size() +
               " comment(s). Click here to view.\n";
    }
}
```

# Overriding `toString`

- Explicit print methods can often be omitted from a class:

```
System.out.println(post.toString());
```

- Calls to **`println`** with just an object automatically result in **`toString`** being called:

```
System.out.println(post);
```

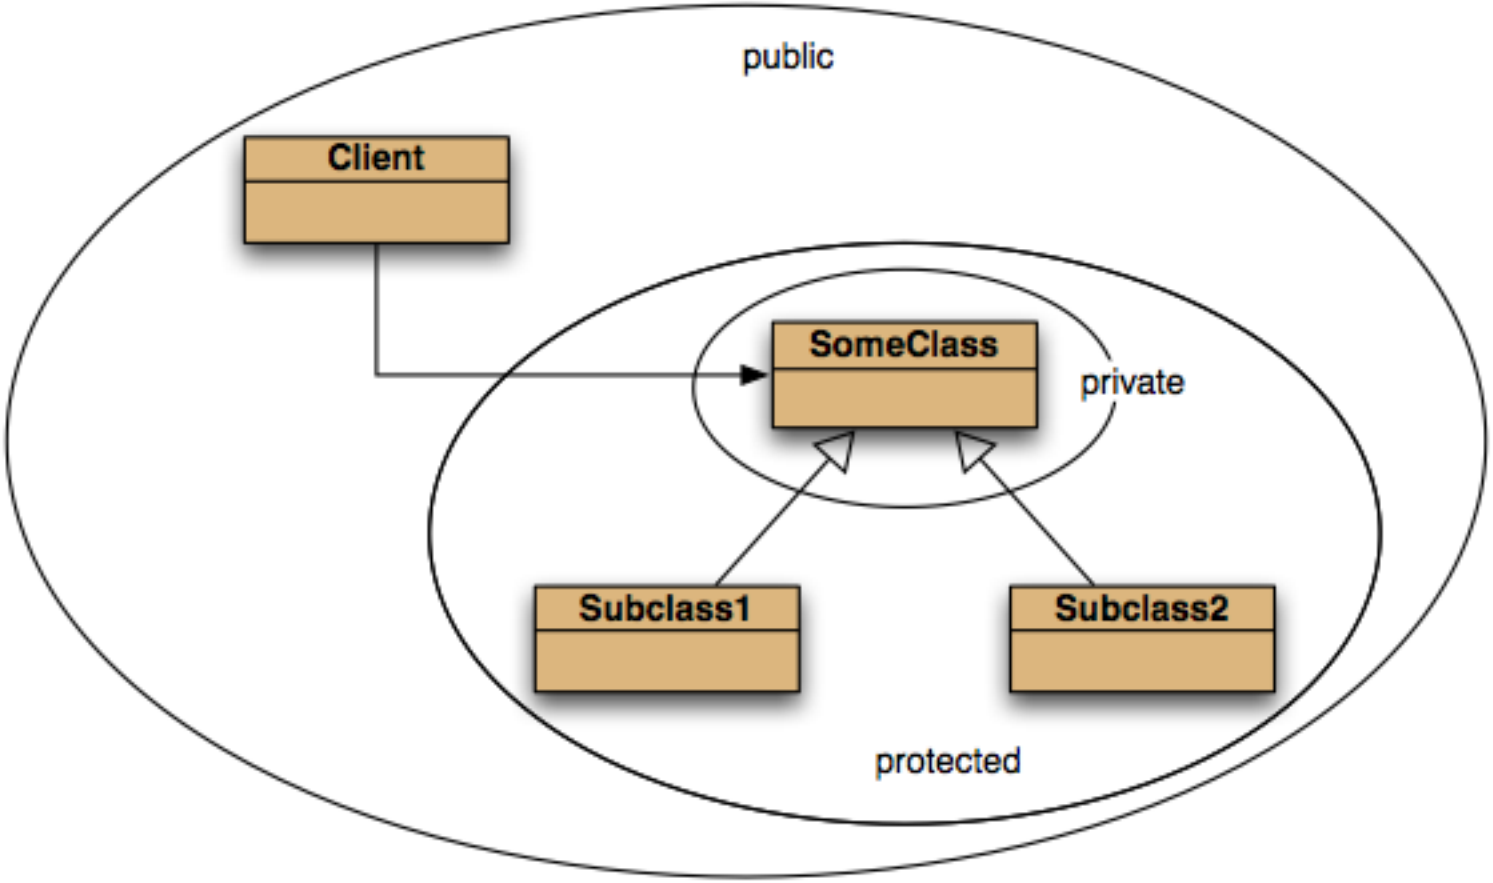
# Topic List

- Method polymorphism
- Static and dynamic type
- Overriding
- Dynamic method lookup
- Protected access

# Protected access

- *Private* access in the superclass may be too restrictive for a subclass.
- The closer inheritance relationship is supported by *protected* access.
- *Protected* access is more restricted than *public* access.

# Access levels



# Review

- The declared type of a variable is its static type.
  - Compilers check static types.
- The type of an object is its dynamic type.
  - Dynamic types are used at runtime.
- Methods may be overridden in a subclass.
- Method lookup starts with the dynamic type.
- Protected access supports inheritance.

# Any Questions?
