Topic list

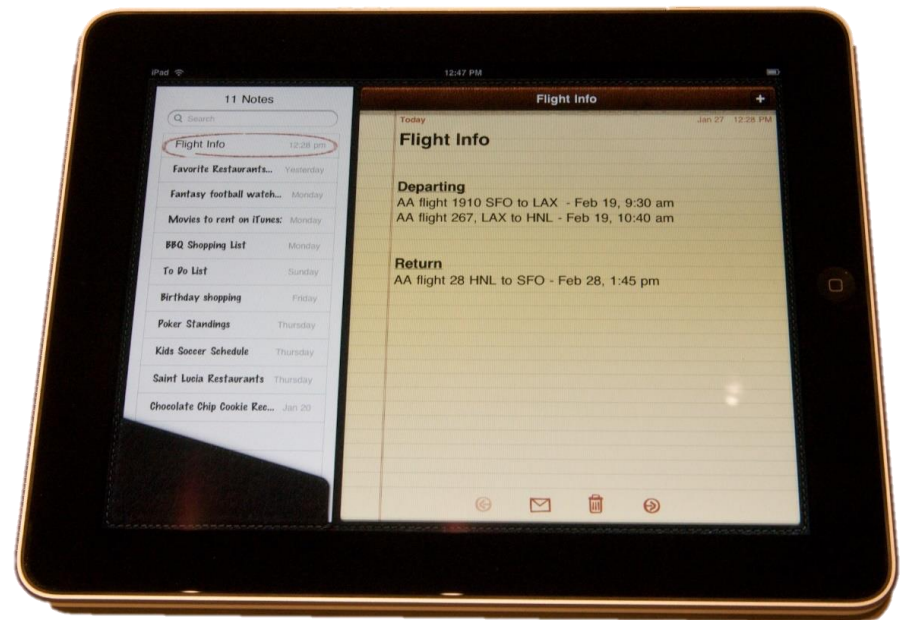

1. Grouping Objects
 - Developing a basic personal notebook project using **Collections** e.g. **ArrayList**
2. **Indexing** within Collections
 - Retrieval and removal of objects
3. **Generic classes**
 - e.g. ArrayList
4. **Iteration**
 - Using the for loop
 - Using the while loop
 - Using the **for each** loop
- Next SlideDeck:
coding a Shop Project that stores an ArrayList of Products.

The requirement to **group objects**

- Many applications involve **collections** of objects:
 - Personal organizers.
 - Library catalogs.
 - Student-record system.
- The **number of items** to be stored **varies**:
 - Items added.
 - Items deleted.

Example: A personal notebook

- Notes may be **stored**.
- Individual notes can be **viewed**.
- There is **no limit** to the number of notes.
- It generally **tells you how many** notes are stored.

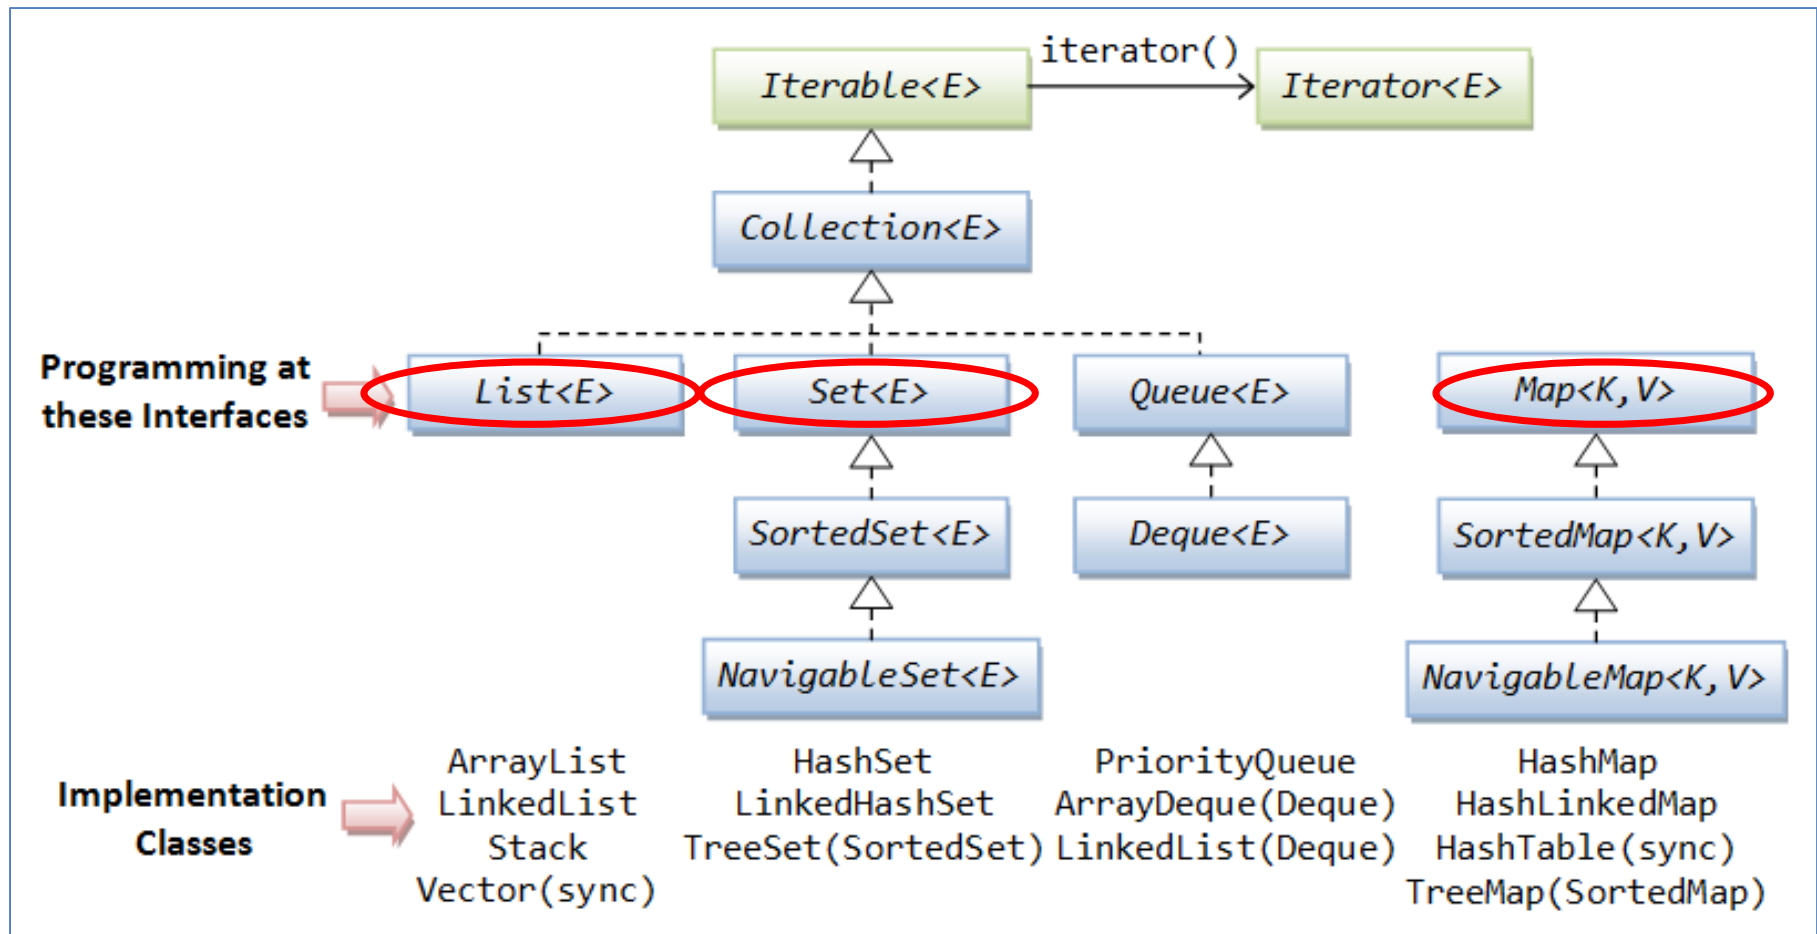

Java API: the class library

- Many useful classes.
- We don't have to write everything from scratch.
- Java calls its libraries, ***packages***.

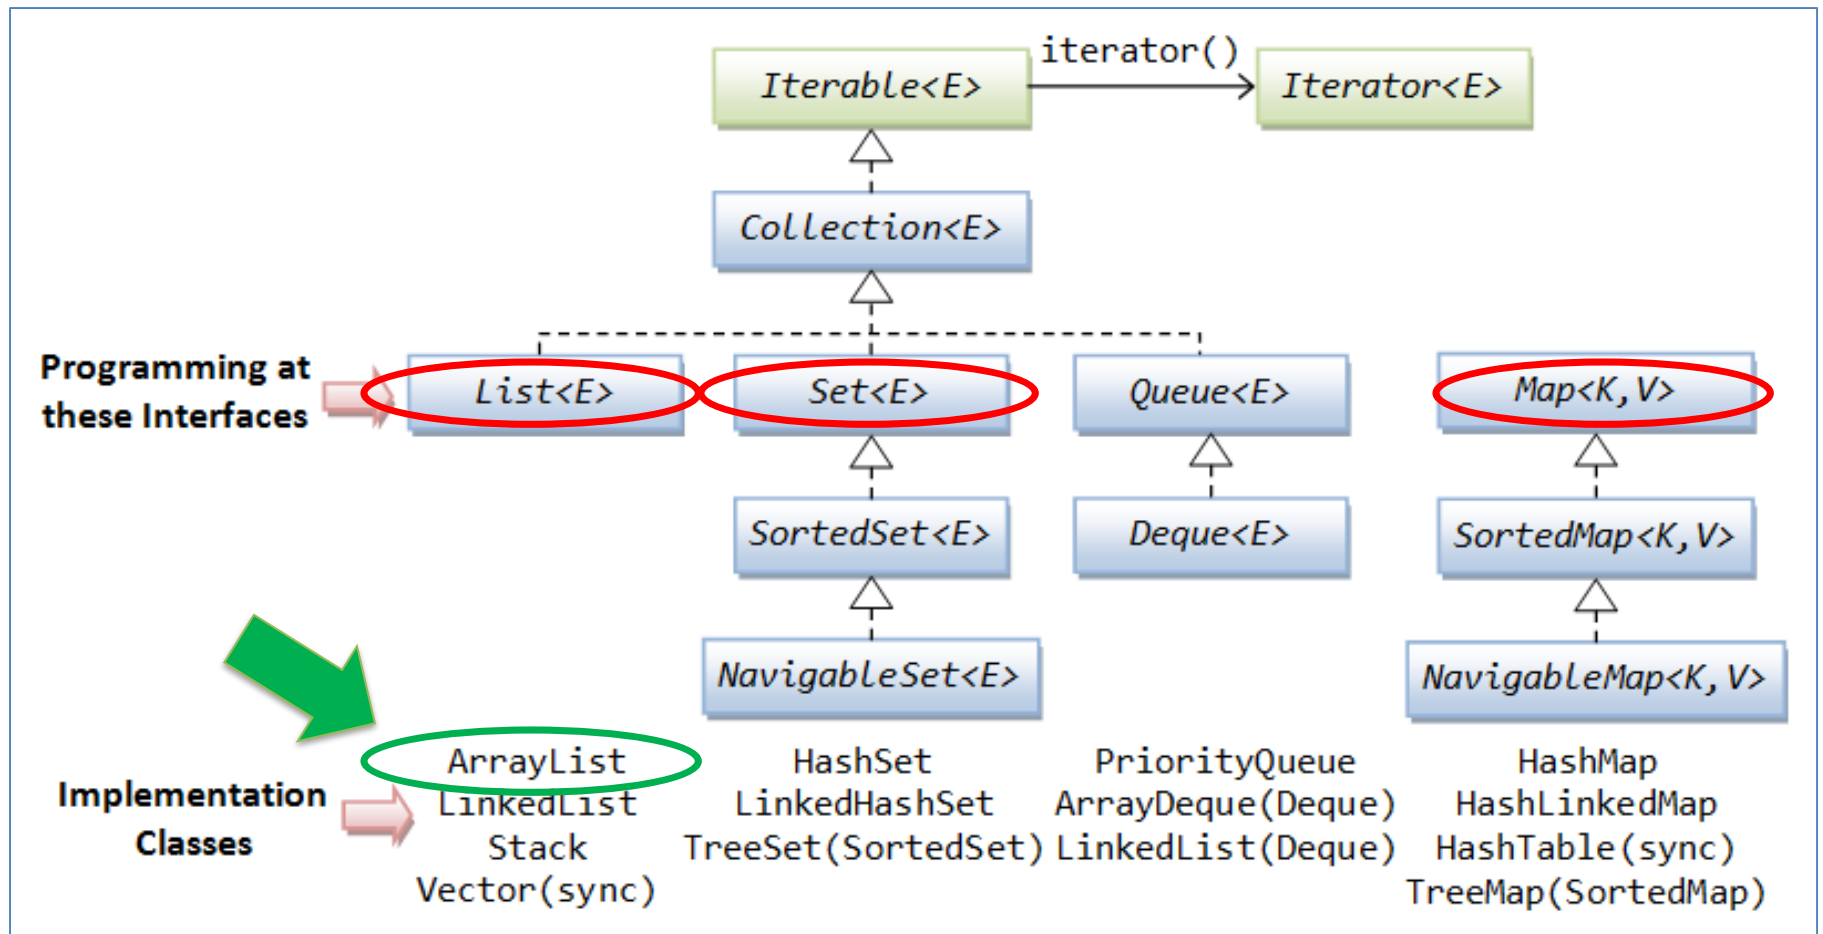

Back to the notebook:

- Grouping objects is a recurring requirement.
 - The `java.util` package contains classes for doing this ...the **Collections Framework**.

Java's Collections Framework

Java's Collections Framework

ArrayList Collection

- We specify:
 - the **type of collection**
 - e.g.: **ArrayList**
 - the **type of objects** it will contain
 - e.g.: **<String>**
- We say
 - **“ArrayList of String”**

```
import java.util.ArrayList;  
  
public class Notebook  
{  
  
    // Storage for an arbitrary number of notes.  
    private ArrayList <String> notes;  
  
    // Perform any initialization required for the notebook.  
    public Notebook()  
    {  
        notes = new ArrayList <String> () ;  
    }  
  
}
```

```
import java.util.ArrayList;
```

import the ArrayList package

```
public class Notebook  
{
```

```
    // Storage for an arbitrary number of notes.  
    private ArrayList <String> notes;
```

```
    // Perform any initialization required for the notebook.  
    public Notebook()  
    {  
        notes = new ArrayList <String> () ;  
    }
```

```
}
```

```
import java.util.ArrayList;  
  
public class Notebook  
{  
  
    // Storage for an arbitrary number of notes.  
    private ArrayList <String> notes;
```

declares notes as a private
"ArrayList of <String>"

```
    // Perform any initialization required for the notebook.  
    public Notebook()  
    {  
        notes = new ArrayList <String> () ;  
    }  
  
}
```

```
import java.util.ArrayList;  
  
public class Notebook  
{  
  
    // Storage for an arbitrary number of notes.  
    private ArrayList <String> notes;  
  
    // Perform any initialization required for the notebook.  
    public Notebook()  
    {  
        notes = new ArrayList <String> () ;  
    }  
  
}
```

notes is initialised by calling
the constructor using new

Note **new** and **()**

Object structures with ArrayList

Adding a third note

Features of the **ArrayList** Collection

- It increases its capacity as necessary.
- It keeps a private count
 - **size()** accessor.
- It keeps the objects in **order**.

Details of how all this is done are hidden.

- Does that matter?
- Does not knowing how, prevent us from using it?

```
import java.util.ArrayList;  
  
public class Notebook  
{  
    private ArrayList <String> notes;  
  
    public Notebook(){  
        notes = new ArrayList <String> ();  
    }  
  
    public void storeNote(String note){  
        notes.add(note);  
    }  
  
    public int numberOfNotes() {  
        return notes.size();  
    }  
}
```

Adding a new note
of type String

Returning the
number of notes

Topic list

1. Grouping Objects

- Developing a basic personal notebook project using **Collections**
e.g. **ArrayList**

2. Indexing within Collections

- Retrieval and removal of objects

3. Generic classes

- e.g. ArrayList

4. Iteration

- Using the for loop
- Using the while loop
- Using the **for each** loop

- Next SlideDeck:
coding a Shop Project that stores an ArrayList of Products.

ArrayList: Index numbering

Retrieving an object – **showNote()**

```
public void showNote (int noteNumber)
{
    if(noteNumber < 0) {
        // This is not a valid note number.
    }
    else if(noteNumber < numberOfNotes()) {
        System.out.println(notes.get(noteNumber));
    }
    else {
        // This is not a valid note number.
    }
}
```

Index validity checks

Retrieve and print the note

Removing an object

```
public void removeNote(int noteNumber)
{
    if(noteNumber < 0) {
        // This is not a valid note number, so do nothing.
    }
    else if(noteNumber < numberOfNotes()) {
        // This is a valid note number.
        notes.remove(noteNumber);
    }
    else {
        // This is not a valid note number, so do nothing.
    }
}
```

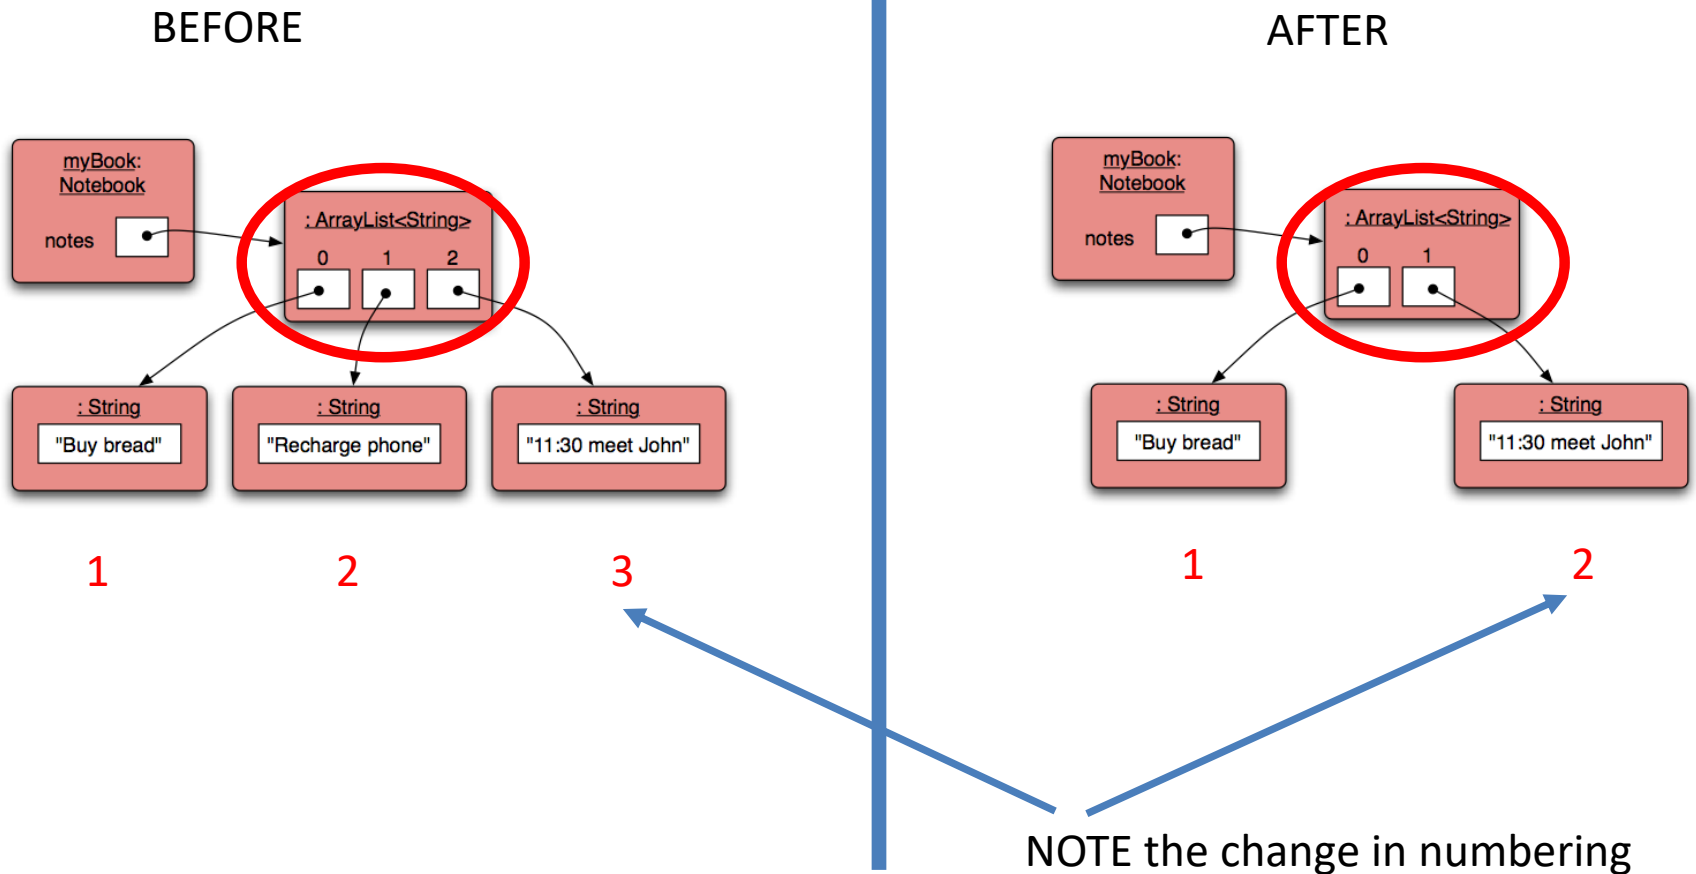

Index
validity
checks

Delete the note at
the specific index

Removal may affect numbering

Removal may affect numbering

Topic list

1. Grouping Objects

- Developing a basic personal notebook project using **Collections** e.g. **ArrayList**

2. Indexing within Collections

- Retrieval and removal of objects

3. Generic / Parameterized classes

- e.g. ArrayList

4. Iteration

- Using the for loop
- Using the while loop
- Using the **for each** loop

coding a Shop Project that stores an ArrayList of Products.

Generic/Parameterized Classes

OVERVIEW PACKAGE **CLASS** USE TREE DEPRECAT

PREV CLASS NEXT CLASS FRAMES NO FRAMES

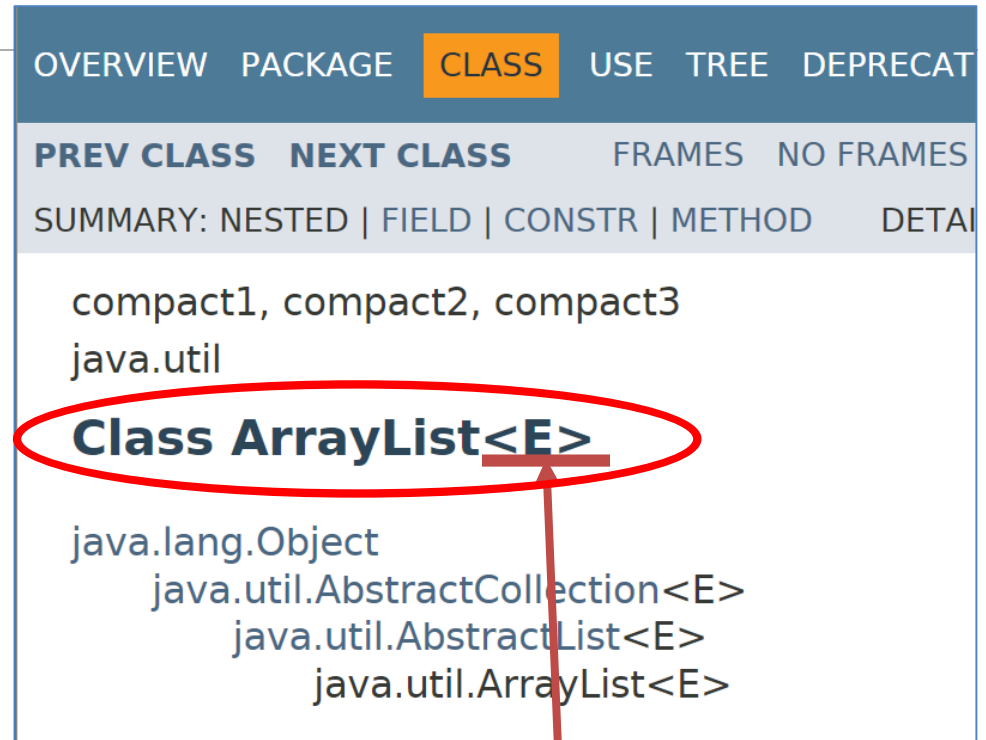

SUMMARY: NESTED | FIELD | CONSTR | METHOD DETAI

compact1, compact2, compact3
java.util

Class ArrayList<E>

java.lang.Object
 java.util.AbstractCollection<E>
 java.util.AbstractList<E>
 java.util.ArrayList<E>

Generic/Parameterized Classes

The screenshot shows the Java API documentation for the `ArrayList` class. The `CLASS` tab is selected in the top navigation bar. Below the navigation bar, there are links for `PREV CLASS`, `NEXT CLASS`, `FRAMES`, and `NO FRAMES`. A summary bar contains links for `NESTED`, `FIELD`, `CONSTR`, `METHOD`, and `DETAIL`. The main content area displays the class hierarchy for `ArrayList`. The class name `Class ArrayList<E>` is circled in red. A red arrow points from the `<E>` parameter to the explanatory text box below.

compact1, compact2, compact3
java.util

Class ArrayList<E>

java.lang.Object
java.util.AbstractCollection<E>
java.util.AbstractList<E>
java.util.ArrayList<E>

Collections are known as *parameterized* or *generic* types.

Note `<E>` is the parameter.

E gets replaced with some Class or Type

OVERVIEW PACKAGE **CLASS** USE TREE

java.lang

Class String

java.lang.Object
java.lang.String

String is not parameterized.

OVERVIEW PACKAGE **CLASS** USE TREE

PREV CLASS NEXT CLASS FRAMES

SUMMARY: NESTED | FIELD | CONSTR | METH

compact1, compact2, compact3
java.util

Class ArrayList<E>

java.lang.Object
java.util.AbstractCollection<E>
java.util.AbstractList<E>
java.util.ArrayList<E>

ArrayList is parameterized.

The **type parameter** <E>
says what we want a list of e.g.:

ArrayList<Person>

ArrayList<TicketMachine>

ArrayList<String>

etc.

Generic/Parameterized classes

- **ArrayList** implements list functionality:

boolean

add(E e)

Appends the specified element to the end of this list.

void

clear()

Removes all of the elements from this list.

E

get(int index)

Returns the element at the specified position in this list.

E

remove(int index)

Removes the element at the specified position in this list.

int

size()

Returns the number of elements in this list.

Topic list

1. Grouping Objects

- Developing a basic personal notebook project using **Collections** e.g. **ArrayList**

2. **Indexing** within Collections

- Retrieval and removal of objects

3. **Generic classes**

- e.g. ArrayList

4. **Iteration**

- Using the for loop
- Using the while loop
- Using the **for each** loop

- Next SlideDeck:
coding a Shop Project that stores an ArrayList of Products.

Processing a whole collection (**iteration**)

- We often want to perform some actions an **arbitrary** number of times.
 - E.g.,
Print all the notes in the notebook.
How many are there?
Does the amount of notes in our notebook vary?
- Most programming languages include ***loop statements*** to make this possible.
- **Loops** enable us to **control how many times we repeat** certain actions.

Loops in Programming

- There are three types of standard loops in (Java) programming:
 - **while**
 - **for**
 - **do while**
- You typically use **for** and **while** loops to iterate over your ArrayList collection,

OR

- you can use another special construct associated with Collections:
 - **for each**

Topic list

1. Grouping Objects

- Developing a basic personal notebook project using **Collections** e.g. **ArrayList**

2. Indexing within Collections

- Retrieval and removal of objects

3. Generic classes

- e.g. ArrayList

4. Iteration

- 
- Using the for loop
 - Using the while loop
 - Using the **for each** loop

- Next SlideDeck:
coding a Shop Project that stores an ArrayList of Products.

Recap: **for loop** pseudo-code

General form of a for loop

```
for(initialization; boolean condition; post-body action)  
{  
    statements to be repeated  
}
```

Recap: **for loop** syntax

```
for(int i = 0; i < 4; i++)
```

```
for(initialization; boolean condition; post-body action)  
{  
    statements to be repeated  
}
```

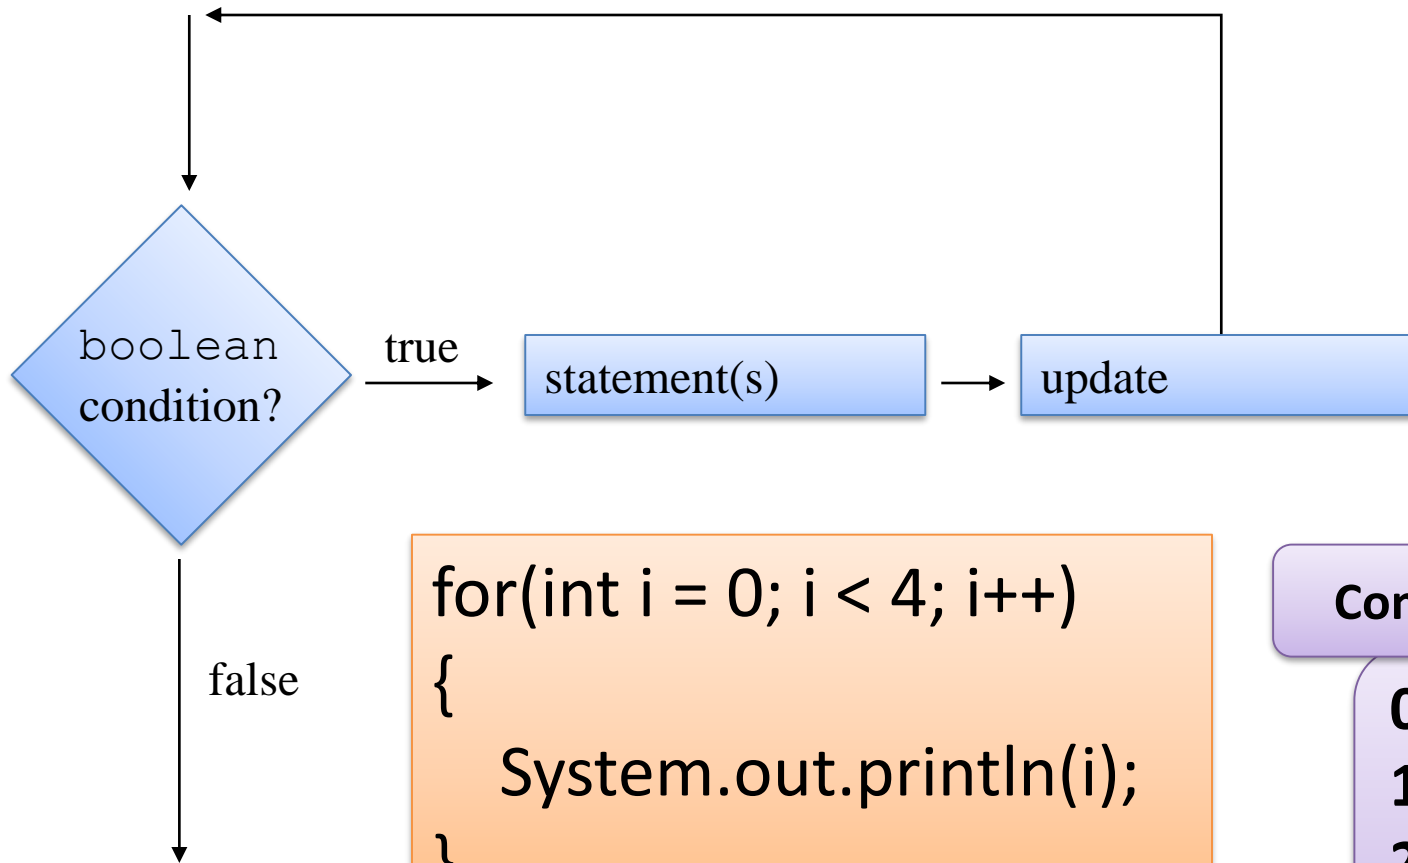

The diagram illustrates the general syntax of a for loop by mapping a specific example to its components. The example code 'for(int i = 0; i < 4; i++)' is shown in a box at the top. Below it, the general syntax 'for(initialization; boolean condition; post-body action) { statements to be repeated }' is shown in another box. Three blue arrows point from the general syntax components to the corresponding parts of the example code: a red arrow from 'initialization' to 'int i = 0;', a green arrow from 'boolean condition' to 'i < 4;', and a blue arrow from 'post-body action' to 'i++'. Additionally, the three components of the example code are individually outlined with red, green, and blue lines respectively.

Recap: for loop syntax

```
for(int i = 0; i < 4; i++)
```

initialization	<code>int i = 0;</code>	Initialise a loop control variable (LCV) e.g. i. It can include a variable declaration.
boolean condition	<code>i < 4;</code>	Is a valid boolean condition that typically tests the loop control variable (LCV).
post-body action	<code>i++</code>	A change to the loop control variable (LCV). Contains an assignment statement.

Recap: for loop flowchart

```
for(int i = 0; i < 4; i++)  
{  
    System.out.println(i);  
}
```

Console Output:

0
1
2
3

for loop: for iterating over a collection

```
/**
 * List all notes in the notebook.
 */
public void listNotes()
{
    for(int i= 0; i < notes.size(); i++) {
        System.out.println(notes.get(i));
    }
}
```

Increment
index by 1

for each value of *i* less than the size of the collection,
print the next note, and then increment *i*

Topic list

1. Grouping Objects

- Developing a basic personal notebook project using **Collections** e.g. **ArrayList**

2. **Indexing** within Collections

- Retrieval and removal of objects

3. **Generic classes**

- e.g. ArrayList

4. **Iteration**

- Using the for loop
- Using the while loop
- Using the **for each** loop

- Next SlideDeck:
coding a Shop Project that stores an ArrayList of Products.

Recap: **while loop** pseudo code

General form of a while loop

while keyword

boolean condition

Statements to be repeated

```
while(loop condition) {  
  loop body  
}
```

Pseudo-code expression of the actions of
a while loop

while we wish to continue, do the things in the loop body

Recap: **while loop** construction

```
Declare and initialise loop control variable (LCV)  
while(condition based on LCV)  
{  
    "do the job to be repeated"  
    "update the LCV"  
}
```

This structure should always be used

Recap: **while** loop flowchart

```
int i = 1;
while (i <= 10)
{
    System.out.println(i);
    i++;
}
```

while loop: iterating over a collection

```
/**
 * List all notes in the notebook.
 */
public void listNotes()
{
    int i = 0;
    while(i < notes.size()) {
        System.out.println(notes.get(i));
        i++;
    }
}
```

while the value of *i* is less than the size of the collection, print the next note, and then increment *i*

for versus while

```
/**
 * List all notes in the notebook.
 */
public void listNotes()
{
    for(int i= 0; i < notes.size(); i++) {
        System.out.println(notes.get(i));
    }
}
```

```
/**
 * List all notes in the notebook.
 */
public void listNotes()
{
    int i = 0;
    while(i < notes.size()) {
        System.out.println(notes.get(i));
        i++;
    }
}
```

Variable **i** is the Loop Control Variable (**LCV**). It must be initialised, tested and changed.

int i = 0 is the **initialisation**.

i < notes.size() is the **test**.

i++ is the post-body action i.e. the **change**.

Topic list

1. Grouping Objects

- Developing a basic personal notebook project using **Collections** e.g. **ArrayList**

2. Indexing within Collections

- Retrieval and removal of objects

3. Generic classes

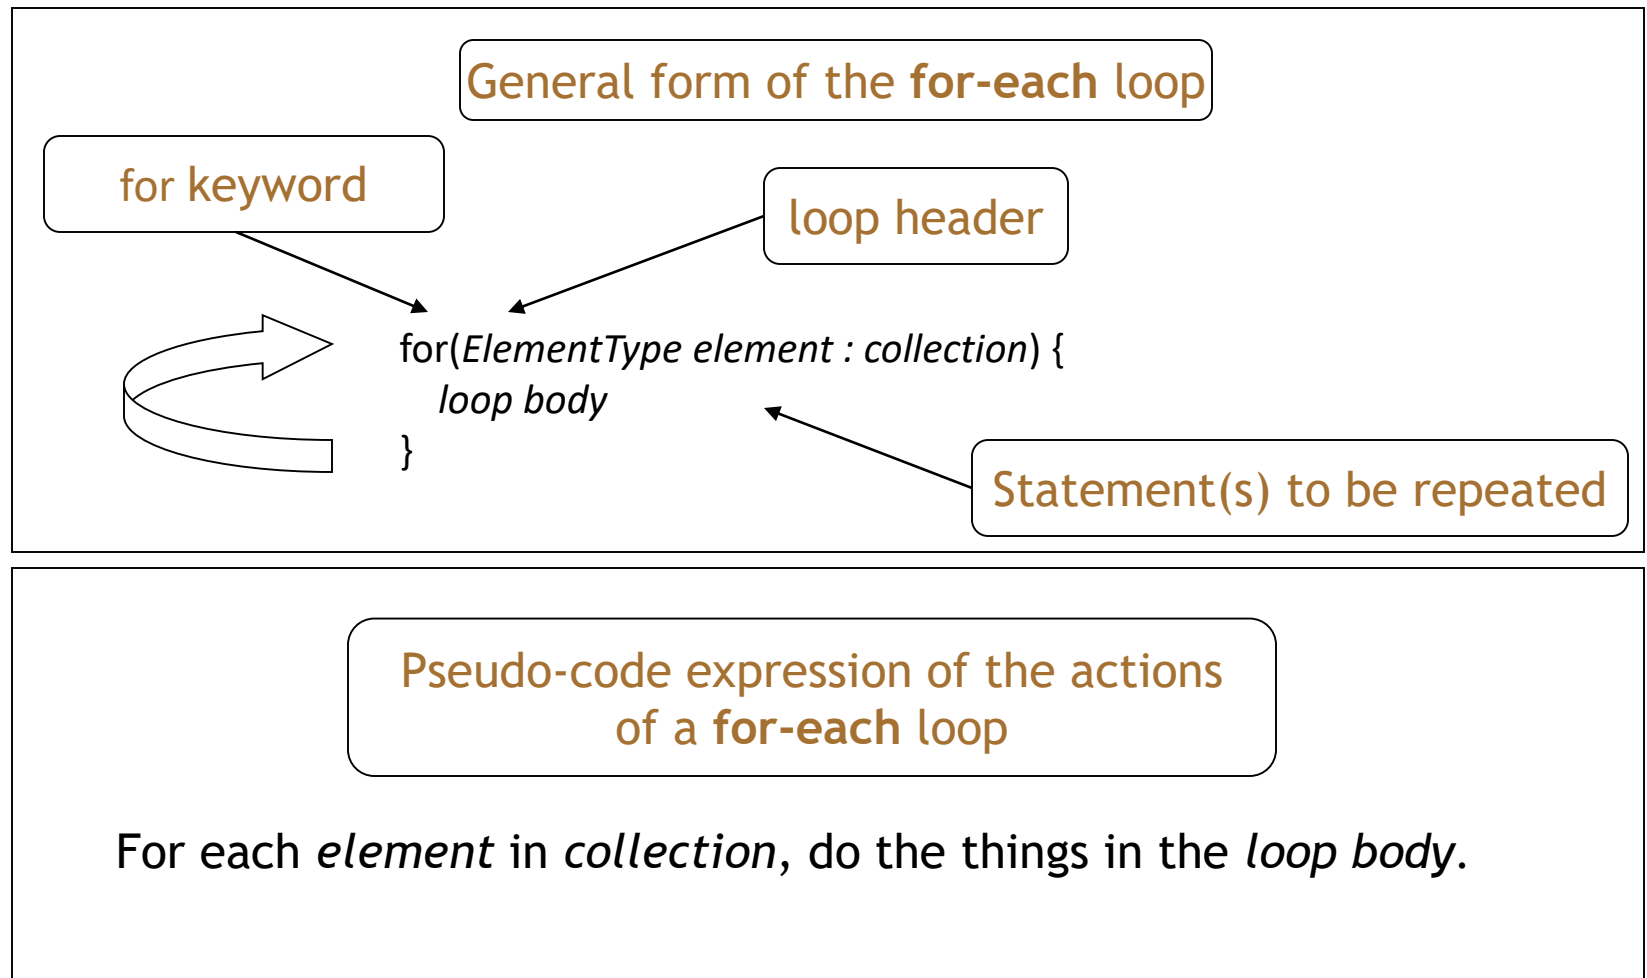

- e.g. ArrayList

4. Iteration

- Using the for loop
- Using the while loop
- Using the **for each** loop ★

- Next SlideDeck:
coding a Shop Project that stores an ArrayList of Products.

for each loop: pseudo code

for each loop: iterating over a collection

```
/**
 * List all notes in the notebook.
 */
public void listNotes()
{
    for (String note : notes) {
        System.out.println(note);
    }
}
```

for each *note* in the *notes* collection, print out *note*

for each loop

- Can only be used for **access**;
 - you can't remove the retrieved elements.
- Can only loop forward in single steps.
- Cannot use to compare two collections.

for each **versus** while

- for-each:
 - **easier to write.**
 - **safer**: it is guaranteed to stop.
- while:
 - we **don't *have* to process the whole collection.**
 - doesn't even have to be used with a collection.
 - take care: could be an *infinite loop*.

Summary

- **Java Collections Framework**
 - **ArrayList**
 - `import java.util.ArrayList;`
 - `private ArrayList <String> notes;`
 - `notes = new ArrayList <String> ();`
 - `notes.add(note);`
 - `notes.size();`
 - `notes.get(noteNumber)`
 - `notes.remove(noteNumber);`
- **Iterating collections**
 - **for each**
 - `for (String note : notes)
{System.out.println(note);}`
